

The web

Below is the code of a sample page that I demonstrated in class. Copy and paste it to a file saved with the .html extension (you can use Notepad, Notepad++, or TextEdit for this). Then you can edit and open in browser simultaneously. Save changes in the editor then refresh the browser.

You can see a [live version of this page](#) in your browser.

```
<html>
  <head>
    <style type="text/css">
      body { margin: 4ex 20%; }
      h1 { background: #fcc; border: 1px solid #f33 }
    </style>
  </head>
  <body>
    <h1>A silly page by Chris League</h1>
    <p>Welcome to my home page!</p>

    

    <h2>My Hobbies</h2>
    <p>I like to:</p>
    <ol>
      <li>Travel around the world</li>
      <li>Take pictures</li>
      <li>Eat all kinds of foods</li>
      <li>Play piano</li>
      <li>Write computer programs</li>
    </ol>
```

Hyperlinks can be deceiving because the URL and the linked text are distinct. They don't need to match. Here's a dubious link to: [Citibank](http://en.wikipedia.org/wiki/Phishing)

```
<h2>Resources</h2>
<ul>
  <li><a href="http://www.w3schools.com/">w3schools</a> is a
    great reference for HTML and CSS.</li>
  <li>I ask and answer programming questions
    on <a href="http://stackoverflow.com/">StackOverflow</a></li>
</ul>
```

```
</body>  
</html>
```
