

# Project 9

due at midnight on Wed Dec 9 (60 points)

The goal of this assignment is to practice simple algorithms on **vectors**, and to implement them using **functions**. Start with the prototypes and the main function provided below.

```
#include <iostream>
#include <vector>
using namespace std;

void print_vector (vector<int> v);
int find_minimum (vector<int> v);
double compute_average (vector<int> v);
int how_many_evens (vector<int> v);

int main()
{
    vector<int> v;
    v.push_back( 3); v.push_back( 5); v.push_back( 8);
    v.push_back( 2); v.push_back(10); v.push_back(-3);
    v.push_back( 7); v.push_back( 6); v.push_back( 4);
    v.push_back( 5); // TODO: better initializer?

    print_vector(v);
    cout << "The minimum is " << find_minimum(v) << "\n";
    cout << "The average is " << compute_average(v) << "\n";
    cout << "There are " << how_many_evens(v)
         << " even numbers.\n";
    return 0;
}
```

Then you will write definitions for the four functions.

- `print_vector` shows every element in the vector, along with its index (as shown below). We already wrote this function in class on 11/20, so check the notes.
- `find_minimum` will return the smallest integer in the vector. (It might be negative!)
- `compute_average` adds up all the integers in the vector and divides by the size, then returns that as a double value.
- `how_many_evens` counts the number of integers in the vector that are divisible by two.

The expected output in this program is as follows. You may want to change around the values initially in the vector to test other possibilities.

```
v[0] is 3
v[1] is 5
v[2] is 8
v[3] is 2
v[4] is 10
v[5] is -3
v[6] is 7
v[7] is 6
v[8] is 4
v[9] is 5
The minimum is -3
The average is 4.7
There are 5 even numbers.
```

Call your program `p9vec.cpp` and submit to [this dropbox for project 9](#).
