

Project 1 — Bootstrap HTML

due at 23:59 on Tue Feb 6 (100 points)

For this assignment, you will design and implement a small static web site using [Bootstrap](#) and hand-coded HTML. It should meet the following requirements:

- It should have three separate HTML pages that are linked to each other.
- Other than the three pages, other links do not need to work, and the text can be “lorem ipsum” (fake).
- Among the three pages there should be at least 4 images.
- At least one page should use a multiple-column layout, achieved using Bootstrap’s grid.
- It should use additional bootstrap visual features such as buttons, badges, a table, or a form.
- It should resize gracefully on smaller devices.

To submit, create a new folder called `assn1` in your git working directory, and save all your files there (including any CSS files, Bootstrap files, and images). Then add, commit, and push your code using the techniques in the [software setup](#).
