

Project 2 — Hugo static generator

due at 23:59 on Sun Feb 25 (100 points)

For this assignment, you will design and implement a web site using the [Hugo](#) static site generator. See my [Hugo notes](#) for tips on getting started.

- Write the contents for at least 3 posts or pages using Markdown notation.
- Edit one or more of the files in the theme to change it at least slightly from the default look.
- Instead of using “Lorem ipsum”, this time try adding some content to make the site into a portfolio or technical blog about your learning experiences.
- **Note:** Before committing again, make sure to add the line `public/` to your `.gitignore` file in your CS120 folder. (This is where hugo puts its generated files.) If you don't have `.gitignore`, it's just a text file (without extension), so you can create it in your text editor.
