

Milestone 2

Tue Mar 6 (150 points)

The goal of this milestone is to produce an `ActivityDetail` component of our travel/experience app (see the image at the [bottom of the README](#) on gitlab – we’re aiming to produce the middle screen).

Also, we will want to generate some sample data. So please produce a text file `sample.json` that contains an activity with at least the following fields:

```
{
  "latitude": 40.691379,
  "longitude": -73.982518,
  "title": "DeKalb Market Hall",
  "type": ["dining", "dessert"],
  "minPrice": 15.00,
  "avgPrice": 20.00,
  "timeNeededMinutes": 60,
  "mood": ["hungry", "casual"],
  "image": "https://static01.nyt.com/images/2017/09/13/business/13foodhallsqft1a-150524",
  "description": "Bustling destination housing 40 food vendors, including old-school &
}
```

Its syntax should be JSON format, readable by Javascript.

A Javascript object like the one above can be used as the props for your `ActivityDetail` component. You can see an example of passing a JSON object into a component in the [JsonViewerApp](#) and [ActivityDetail](#) modules in the `cs164pub/demo` repository.
