

# Milestone 3

Tue Mar 20 (150 points)

For this milestone, we want to produce a `ResultList` component for our travel/experience app (see the image at the [bottom of the README](#) on gitlab – we’re aiming to produce the **lower half** of the **left screen**).

The idea is that it’s a list of results that may have been filtered or ordered according to some criteria. But we want to be able to scroll through those results, and pressing one should switch us to an `ActivityDetail` as in Milestone 2. Then there should be a back button to return to the results list.

There is an initial [samples.json data file](#) available, that I’ll continue to expand as you provide more unique entries for it.

Use the `StackNavigator` technique demonstrated in the [MultiScreenApp example](#).
